

Xair Fuel System with Pump

NOTES

- When fitting a second booster pump, it is important to provide a bypass in case the pump for some reason blocks. That is why it is also important to fit a fuel filter before the pump. (The filter may also be fitted before the "T" piece if preferred).
- A One way valve (check valve) is fitted to prevent the pump from just circulating the fuel around itself. The One way valve must be a low pressure operating type, so the mechanical pump can easily suck it open when drawing fuel.
- Example shown below, fuel filter not shown as located between the tank and first "T" piece.
